Weekly Delight: Claude handoff to Codex

21 October 2026. Written by Claude (recipe content and food-safety owner, integration owner for generated output).

1. State of main

- `main` is at merge commit `c8d95127862832f6f58e3717934dba1631483cad` (PR #20), on top of your PRs #17, #18 and #19.
- Live site checked after the deploy (Hostinger auto-deploys main, about 5 to 6 minutes): 6 of 6 sampled pages match the build byte for byte (edible-cookie-dough, cookie-dough-bites, cookie-dough-bars, trenette-al-pesto, leche-flan, aioli). Earlier on 21 October, 81 of 81 sampled pages matched and 25 random new photo files returned 200; one transient 500 on leche-flan during rollout cleared on recheck. These are samples, not a full-site verification.
- Your rollout concern (leche-flan photo 404) is resolved: page and both image files return 200.

2. What Claude did after your PRs (PR #20)

- IMAGE-CONTENT-01: `trenette-al-pesto` lost its Gluten-Free tag (`src/data/catalog-59.js:65`); the ingredient is ordinary wheat pasta. Ingredient line unchanged.
- Flour: `edible-cookie-dough` (details31), `cookie-dough-bites` (details41), `cookie-dough-bars` (details55). Removed the home 74 C oven step (no validated source). Unbaked dough now specifies flour sold as heat-treated and ready to eat raw; the bars' baked base keeps ordinary flour. Row cook times changed to 0 and 3 minutes because the flour step was removed (`catalog-31.js:115, catalog-41.js:113`); no times were invented. Whether any product is truly ready to eat is the label's claim and was not verified.
- `tools/food-handling-audit.js` raw-flour rule and its self-test cases updated to require ready-to-eat flour in the ingredients.
- Output rebuilt by Claude. Checks: `npm run build`, `npm run check` (all passed), `npm run selftest` 64/64, food audit 0 confirmed, consistency audit 0 open, `tools/ads-unchanged.js --against 40a2386f` unchanged.

3. Earlier Claude work already in main (PR #16)

Timing reader and untimed-wait disclosure, 832 baseline findings all resolved (560 corrected, 272 valid exceptions), and 155 food-handling corrections (oil preserves 4 days, unprocessed jars to the fridge, pasteurised eggs, fish parasite freezing, marinades, custard cooling). New `tools/food-handling-audit.js` (`npm run food`). Details: `docs/release-2026-10-uncertainties/COMPLETION-REPORT.md, food-handling-review.md, resolutions.json.`

4. Not done (open for Codex or the owner)

- Your 236-record queue (`docs/release-2026-10-uncertainties/codex-review-findings.json`: 231 open, 5 specialist). Claude has NOT worked through it; the flour and trenette items above are the only ones addressed.
- Your unmerged validator batch (`fix/recipe-validation-review`, and the UNMERGED-validator-source-review.patch). Claude has not seen it and has not reconciled overlaps. Claude changed `tools/food-handlin`

`g-audit.js`, `tools/check.js`, `tools/recipe-consistency.js`, `tools/consistency-*.js`, `src/lib/timing.js` earlier in the project: expect conflicts there.

- `popularity = reviews * rating` in `src/build.js:421` is still an ordering weight (not printed as reviews).
- Photo sourcing for the 1,237 recipes with no picture (owner excluded this from Claude's scope).

5. Evidence still needed (do not guess)

Item	Evidence needed
Macarons shell cooling and ganache firming	One real timed bake
Aguachile (raw prawns); steak tartare and carpaccio (raw beef)	Specialist decision on keeping and wording
Makdous, betengan mekhalel, giardiniera	Tested process (pH, salt) or validated acidification
Miso ramen tare (raw garlic, 3 weeks)	Salt and water-activity figures, or specialist review
717 recipes with fridge lives over 4 days (`food-long-fridge-lives.md`)	Per-category shelf-life policy
Runny yolks catalogue-wide	Editorial and specialist decision
Flour products named as ready to eat raw	Manufacturer label evidence, if the owner wants a named product

6. Rules both sides follow

Do not edit the other's files without telling them; keep ads, monetization, recipe URLs and working features unchanged; no invented testing, cooking times or safety claims; no bulk deletion, noindex or redirects; generated files are rebuilt only by the integration owner (Claude) after both sets of changes are reviewed; do not deploy without the owner.

7. Owner tasks outside the repository

- Google Search Console: add the TXT record `google-site-verification=iANfaIwBdtgnyiltf9BWYdlVx_8loC2ZpciV2W8Ct_s` for weeklydelight.com at the domain provider (Hostinger DNS), then press Verify. Not yet done as of this note. Claude cannot do it: the Hostinger connector is not signed in.
- Clear Hostinger's cache after deploys if stale pages appear (the CDN was passing pages through at last check).

8. Read first

`docs/HANDOFF.md` (shared state, maintained by both), this file, then `docs/release-2026-10-uncertainties/COMPLETION-REPORT.md`.
